Summary

I am an empirical operations management researcher whose work examines how organizations and markets adapt under uncertainty. My research studies how information frictions, incentives, risk exposure, and operational constraints shape decision quality across supply chains, emergency response, prediction markets, and AI-enabled decision-support settings. My senior management experience in large financial organizations strengthens my industry connections and helps me bring applied analytics, finance, and managerial decision-making into the classroom.

Research interests: Sustainable operations management; Supply-chain resilience; Organizational and market adaptation; AI-enabled decision support.

Education

University of Waterloo, Waterloo, Canada Ph.D. in Mgmt. Sciences (OR) Jun 2026
Dissertation: Data-Driven Decision-Making Under Uncertainty: An Empirical Study of U.S. Wildfire Management.

Research Award: Finalist, Canadian Operational Research Society (CORS) Student Paper Competition (2026).

Ivey Business School, London, Canada M.Sc. in Mgmt. Sciences May 2018

University of Victoria, Victoria, Canada B.S. in Fin. Math. and Econ. Jun 2016

Research Award: Jamie Cassels Undergraduate Research Awards (2014).

Peer-Reviewed Publications

- **Sustainable Wildfire Management Meets Social Media: How Virtual Interaction Affects Wildfire Response Costs.**

Garros Gong, S. Dimitrov, M. R. Bartolacci / Production and Operations Management (2026)

This paper estimates how public visibility reshapes emergency resource allocation using California wildfire and social-media data. It identifies a Visibility Efficiency Paradox in which urgency signals increase responsiveness but weaken cost efficiency as resource use approaches saturation.

- **Trade-Policy Exposure and Managerial Adjustment Margins: Regime-Dependent Evidence from Corporate Tax-Base Outcomes.**

Garros Gong, S. Dimitrov / Managerial and Decision Economics (2026)

This paper uses the 2018 U.S. tax reform as a policy-regime break to study how tariff pressure shapes internal tax planning and profit-shifting choices. The pattern weakens after reform, and a policy-regime mapping simulation links geographic scope to operating decisions and internal organizational adjustments.

- **Digital strategies in wildfire management: Social media analytics and Web 3.0 integration.**

Garros Gong, S. Dimitrov, M. R. Bartolacci / Discover Sustainability (2024)

This paper combines social-media analytics and Web 3.0 in a framework for wildfire monitoring, prediction, and response. The design uses digital signals as decision inputs and sets explicit requirements for transparency, coordination, and system responsiveness.

Conference Presentations

- *Digital Strategies in Wildfire Management: The Advantage of Applying Social Media Analytics and Web 3.0 Integration.* 2024 INFORMS Telecommunications and Network Analytics Conference, Dallas, TX.

Selected Research

- **Benchmarking Supply Chain Resilience: An Exposure-Conditioned Decision-Support Framework.**

Status: Major Revision / Omega

This paper develops an exposure-conditioned resilience benchmark and extends it into AAR-O for downstream risk assessment. Across 33,071 U.S. public-firm-years, conditioning cuts the residual's association with observed shock conditions by 48.2%. AAR-O improves prediction for some of the eight downside targets.

- **The Task-Specific Predictive and Decision Value of Customer Reconfiguration.**

Solo-authored / Under Peer Review / Management Science

This paper tests the target-specific value of customer-network movement at a fixed decision time and under scarce monitoring capacity. Movement predicts later network instability and improves network-surveillance allocation. Its incremental value is small for operating-recovery ranking and downside allocation, linking signal value to the operational target.

- **When Text Helps: AI Text Signals for Calibration-Sensitive Tail-Risk Decisions in Prediction Markets.**

Status: Major Revision / Decision Sciences Journal

This paper pairs an auditable AI-text measurement pipeline with rolling out-of-sample tests of next-day downside risk in Polymarket. Text improves calibration and selected decision thresholds. Ranking gains are smaller, and directional value falls as the top-two price gap widens.

- **Risk-Responsive Public Resource Allocation: Evidence and Decision Design in U.S. Wildfire Management.**

Status: Under Peer Review / Manufacturing & Service Operations Management

This paper studies recurring public-resource allocation with inherited allocations, decision-time risk information, and bounded adjustment. It introduces allocation adjustment productivity and shows that bounded risk-guided reallocations improve realized alignment with less turnover, while simple historical signals remain competitive with model-based forecasts.

- **Integration Without Synchronization: Stage–Channel Fit in Firms’ Climate Strategies Under Political Rollback Signals.**

Status: Under Peer Review / Strategic Management Journal

This paper uses stage-contingent event-time comparisons to identify how firms rebalance market-facing and nonmarket climate strategies around political rollback signals. Estimates from climate disclosures of 301 U.S. firms show that visible target-setting leads during anticipation, while direct policy engagement rises after policy direction crystallizes.

- **A Multi-Margin View of Financial Decisions: Valuation and Trading Around the 2013 U.S. Tax Changes.**

Status: Under Peer Review / Journal of International Financial Management & Accounting

This paper uses event-time models to uncover distinct adjustment paths in valuation and trading around the 2013 U.S. tax changes. Return adjustment concentrates early, while exposure-linked trading declines persist under participation, liquidity, and investor-incentive frictions.

Research Pipeline

- **Post-Shock Supply-Chain Adaptation.** Uses uncertainty-aware ML to flag Revere-network post-tariff estimates sensitive to unobserved supplier weights.
- **Supplier Escape Capacity.** Tests whether pre-shock sourcing flexibility improves supplier reallocation after trade-policy shocks through rolling allocation decisions.

Teaching Experience

Centennial College, Toronto, Canada — *Adjunct Professor* 2022–2023

Financial Analytics: student evaluation 4.25/5.00.

Prepared to teach: Operations Management; Business Analytics; AI in Business; Management Science.

Professional Experience

CIBC Mellon, Toronto, Canada — *Director, Profitability and Pricing* 2025–2026

Led pricing and client-profitability analytics and applied AI tools to these decision processes.

Scotiabank, Toronto, Canada — *Manager, Investment Strategist* 2023–2025

Built macroeconomic, machine-learning, and factor-model analytics for investment strategy.

Central 1 Credit Union, Toronto, Canada — *Credit and Financial Analyst* 2022–2023

Supported treasury portfolio analysis, liquidity planning, and risk monitoring.

Marret Asset Management, Toronto, Canada — *Associate, Fixed Income Research* 2021–2022

Built market-data pipelines and trading-signal analytics for fixed-income decisions.

Vinzan International Inc., Toronto, Canada — *Financial and Corporate Analyst* 2018–2020

Built valuation and pro forma models for corporate finance decisions.
